(54) Title: IMPLANT

(57) Abstract: An implant (4) is intended to be fitted in a hole (5) formed in a jaw bone (1). The implant comprises an outer surface (9) which can interact with the soft tissue or connective tissue (2) of the jaw bone and which can be placed at the mouth (6) of the hole. The surface (9) is provided with one or more porous outer layers (10) intended to promote integration between the surface and the soft tissue (2) and to counteract penetration of organisms or bacteria that cause inflammation. By means of this arrangement, continued and substantial integration is maintained between the surface and the tissue. Previous production methods for the implant can be retained with only minor modifications.
